

Figure 4.5. A-D: Lateral geochemical trends in C-zone unaltered braunite lutite observed from south (G558) to north (Rex 16) in the study area. E-H: Geochemical trends observed for the M-Zone with increasing degree of supergene alteration. Reference boreholes selected are Rex 85 (unaltered braunite lutite), Rex 70 (weakly supergene altered braunite lutite) and Rex 2 (strongly supergene altered braunite lutite).
