

Figure 4.1. Map illustrating the exact localities of the drill cores sampled for geochemical investigations. Unaltered braunite lutite is represented by Rex 16, Rex 85 and Rex 44; weakly supergene altered braunite lutite samples were obtained from Rex 70, Rex 71 and Rex 74; and strongly supergene altered braunite lutite samples are from Rex 2 and Rex 24. Please note that a complete set of geochemical data is also available for drill core G558 in the Mamatwan Mine area (Preston, 2001).
