

Figure 2.10 North-south section of the Lower Manganese Body through the study area using selected drill cores (ref. Fig. 2.6). Dramatic thinning between Rex 44 and Rex 85 is evident. The overall thinning can be mainly attributed to thinning of the M and C-zones, i.e., the lower part of the economic zone. E - Supergene manganese ore logged by Preston (2001), Ox. L - Oxidised hematite lutite
